It consists of two bodies with several rollers according to thickness and speed.

### Description.

Roller straighteners for wire rod.

- It is an accessory that serves to straighten the wire that feeds a machine.
- The straightener is installed prior to a drag box and after a motorized winder, which are not included.
- The wire passes through the straightener by the mechanical traction of the drag box.
- It consists of two bodies with several rollers, a body in a horizontal position and another in a vertical position.
- The number of rollers of each body will be adjusted to the client's requirements.

## Construction of Machinery for wire deformation

- The upper rollers are fixed and only the lower ones are adjusted, to facilitate straightening.
- By means of an eccentric system, the rollers are separated, facilitating the introduction of the wire.
- To adjust the rollers, only the tensioning screw must be tightened, without having to loosen the rollers.
- The straightener model is specified by the client's requirements:
  - Wire thickness, type and specifications.
  - Maximum speed that it must support.

It incorporates perforated sheet metal covers for safety.

It is functional, robust and easy to use.

It complies with the European regulations approved and required by the CE: Machines 98/37 / CEE.

### Capability.

Roller straighteners for wire rod.	
Mechanical traction	External
Wire / Rod:	
- Ø Thickness (0.3 to 16 mm)	On request
- Maximum hardness	On request
Accepted speed	On request
Roller quantity:	
- Horizontal body (*)	(*)
- Vertical body (*)	(*)
Counter for positioning	On request
The straightener:	
- Measurements	To Consult
- Weight	To Consult
Documentation: Spanish or English	On request
Manufacturing	+ - 2 months
(*) It is designed according to customer requirements: Thickness / Hardness / Speed
